GitHub CLI One-Click Kit

Install **GitHub** with a few clicks, and use it through a **Korean/English menu**. You don't need to memorize any commands — just pick a number from the menu.

This kit is an **UNOFFICIAL helper**. It is NOT affiliated with, sponsored by, or endorsed by GitHub, Inc. See [10. License](#) below.

1. What is this kit

GitHub CLI (`gh`) is the **official program made by GitHub** that lets you work with GitHub from your computer using commands instead of the website. Normally you have to type English commands yourself.

This kit is a set of **3 batch files (.bat)** that **install `gh` for you** and let you use it through a **simple menu**.

File	What it does
<code>INSTALL.bat</code>	Installs GitHub CLI automatically (upgrades it if already present).

File	What it does
<code>RUN.bat</code>	Opens the menu control panel (login, repos, issues, search, and more).
<code>UNINSTALL.bat</code>	Safely removes GitHub CLI (can back up your settings first).

Important: This kit does **NOT bundle** `gh`. When installing, it fetches `gh` **directly from official sources** (winget, Scoop, or the official GitHub download page).

2. Prerequisites / required software

Before installing, make sure you have:

- **Operating system:** Windows 10 (22H2 or later) or Windows 11
- **Internet connection:** needed for installing, signing in, and most features.
- **GitHub account:** if you don't have one, sign up for free at <https://github.com>
- **An install tool (one of these — optional):**
 - **winget** — **built into** Windows 10 22H2+ and Windows 11.
 - **Scoop** — optional. <https://scoop.sh>
 - You don't need either. The kit can **download the official installer (.msi) directly**.

There is nothing to install in advance. `INSTALL.bat` handles everything.

3. How to download

1. Get the folder (or ZIP file) that contains this kit.
2. **If you received a ZIP**, right-click it → **Extract All** first. (Running directly from inside a ZIP may not work.)
3. Once you see `INSTALL.bat`, `RUN.bat`, and `UNINSTALL.bat` in the extracted folder, you're ready.

If a "**Windows protected your PC**" (**SmartScreen**) dialog appears → click **More info** → **Run anyway**. This is a normal one-time prompt for files downloaded from the internet.

4. Quick start — just 3 steps

1. Double-click `INSTALL.bat` → GitHub CLI gets installed. (When it finishes, it asks "Start now?" — press **Y** to continue.)

2. Double-click `RUN.bat` → the menu window opens.
3. In the menu, choose `[17] Easy Start` → it guides you through **login to repository in 1-2-3 steps**.

How login works: an **8-digit code** appears on screen. Copy it, paste it into the browser that opens automatically, and click **Authorize**. Done.

If you prefer to do it manually, choose `[1] Login` → `[1] Login - Browser` in the menu.

5. File locations / document locations

All files of this kit live **in one folder** (wherever you placed it).

Executables

- `INSTALL.bat` — install
- `RUN.bat` — use (menu control panel)
- `UNINSTALL.bat` — uninstall

Documents

- `README.md` (Korean) / `README.en.md` (this document, English)
- `GUIDE.md` (detailed, Korean) / `GUIDE.en.md` (English)
- Same content as PDF: `README.pdf` , `README.en.pdf` , `GUIDE.pdf` , `GUIDE.en.pdf`
- `사용법-먼저읽기.txt` — shortest start guide (plain text, Korean)

License / notices

- `LICENSE` — full Apache License 2.0 text
- `NOTICE` — copyright, trademark, and non-affiliation notice

Files that may be created automatically

- `gh-help-log.txt` — created if you choose "save result" in `[16] Troubleshoot` .

6. What you can do (feature summary)

When you open `RUN.bat` , you'll see these **17 menus** (each has more options inside; see [GUIDE.en.md](#) for details).

No.	Menu	What it does
1	Login	Sign in/out of your GitHub account, check status, switch accounts

No.	Menu	What it does
2	Repository	Create, clone, list, delete, fork, archive code repositories
3	Pull Request	Create, view, merge, review code-change proposals (PRs)
4	Issue	Create and manage issues (tasks/bugs), comments, labels
5	Gist	Quickly share code snippets / notes
6	Release	Create release versions, upload/download files
7	Workflow/Actions	View, re-run, and inspect logs of automation runs
8	SSH/GPG keys	Manage keys for secure access and signing
9	Extensions	Install and manage gh extensions
10	Config/Alias	Settings and shortcuts for frequent commands
11	Search	Search repositories, issues, code, and more
12	Codespace	Cloud development environments
13	API call	Call the GitHub API directly (advanced)
14	Version/Update	Check and update the gh version
15	Direct command	Type gh commands directly (advanced)
16	Troubleshoot	Not working? Auto-checks internet/install/login + gives fixes
17	Easy Start	New here? Guided 1-2-3 steps (recommended)

7. Safety notes

- **Irreversible actions** (delete/remove) require you to type **YES** on screen before they proceed. (A safeguard so nothing is deleted by accident.)
- When uninstalling (`UNINSTALL.bat`), it asks whether to **back up your settings first**.
- This kit does **not store your password or personal data**. Login uses GitHub's official process (`gh`) directly, and **everything runs on your own computer**.

8. When something goes wrong

- **If anything doesn't work** → open `RUN.bat` and choose **[16] Troubleshoot** . It **auto-checks** internet/install/login status and tells you how to fix it.

- **"gh not found"** → **restart** the terminal window or your PC. (Right after install, it takes a moment for the path to update.)
- **If install fails** → right-click `INSTALL.bat` → **Run as administrator**. (`INSTALL.bat` also asks for this automatically when it lacks privileges.)
- **If it looks like a network error** → check your Wi-Fi/cable. On a corporate network it may be a firewall.

For a more detailed table, see ["Troubleshooting" in GUIDE.en.md](#).

9. How to uninstall

1. Double-click `UNINSTALL.bat` .
2. It asks whether to **back up** your settings (type `y` if you want to).
3. Type `YES` to confirm → it logs out → removes gh → cleans up settings/cache.

The kit folder itself (.bat files and docs) stays. If you no longer need it, move the folder to the Recycle Bin.

10. License · copyright · trademarks · commercial use

- **License:** This kit is distributed under the **Apache License 2.0**. The full text is in [LICENSE](#) .
 - **Copyright:** Copyright 2026 SoDam AI Studio.
 - **Commercial use:** Apache-2.0 **permits commercial use**, provided you:
 - include a copy of `LICENSE` and keep the copyright/notices when you distribute it;
 - state that you changed the files if you distribute a modified version;
 - keep the contents of the `NOTICE` file.
 - **Trademarks:** "GitHub" and "GitHub CLI" are trademarks of GitHub, Inc. "Windows" is a trademark of Microsoft. This kit uses these names **for description only**; the license grants no trademark rights.
 - **No affiliation:** This kit is **unofficial** and has no affiliation, sponsorship, or endorsement from GitHub, Inc.
 - **No bundled third-party software:** This kit does not bundle or redistribute `gh` . `gh` is a separate product distributed by GitHub, Inc. under the **MIT License** (<https://github.com/cli/cli>).
-

11. Disclaimer (no warranty)

- This kit is provided **"AS IS"**, **without warranty** of any kind.
- The author is **not liable for any damages** arising from the use of this kit. You use it **at your own risk**.
- See Sections 7 and 8 of [LICENSE](#) for the full warranty disclaimer and limitation of liability.

- **Developer note:** the `.bat` files are saved as **UTF-8 (no BOM)** and rely on the first line `chcp 65001` to display Korean correctly. **If you re-save them as ANSI/CP949 (e.g., in Notepad), the Korean text will break.** Always save as **UTF-8** when editing.
